

Are Your Patient's Kidneys Up to the Test?

Chronic Kidney Disease (CKD) May Be Progressing Undetected in Patients With Type 2 Diabetes (T2D)

OF THE **32.6 MILLION** PEOPLE IN THE UNITED STATES WITH **TYPE 2 DIABETES**,¹ **UP TO 40%** DEVELOP **CKD**²

Historically, early detection of CKD has been a challenge, with ~6% of cases of CKD stages 1-2 in patients with T2D detected by primary care providers in a 2011-2012 cohort³

CKD PROGRESSION MAY GO UNDETECTED BECAUSE **PATIENTS DO NOT RECEIVE THE RECOMMENDED SCREENING TESTS FOR KIDNEY FUNCTION AND DAMAGE**³⁻⁵

While 85% of patients are screened for kidney function using eGFR,

<50%

of patients with diabetes receive the recommended annual UACR test for kidney damage^{3,4,a}

To help address this gap in care, the National Committee for Quality Assurance has approved a HEDIS[®] measure of Kidney Health Evaluation for Adults with Diabetes. This measure, along with recommendations from the American Diabetes Association and Kidney Disease Improving Global Outcomes (KDIGO), will help drive performance of evidence-based UACR and eGFR tests.^{4,6,7} Prioritizing these kidney health assessments may improve kidney health and patient care quality for those with CKD associated with T2D

IN PATIENTS WITH T2D, ONSET OF ALBUMINURIA (UACR ≥ 30 mg/g) IS ASSOCIATED WITH **INCREASED CARDIOVASCULAR MORTALITY** AND CAN OCCUR YEARS BEFORE **eGFR DECLINE (<60 mL/min/1.73 m²) AND CKD PROGRESSION**⁸⁻¹⁰

Albuminuria is a marker of kidney damage and a critical risk factor for CKD progression and cardiovascular events^{11,12}

Patients with T2D should be monitored at least annually for CKD using both UACR and eGFR tests⁶

To learn more about CKD associated with T2D, your patients can visit:

eGFR, estimated glomerular filtration rate; HEDIS, Healthcare Effectiveness Data and Information Set; UACR, urinary albumin-to-creatinine ratio. HEDIS[®] is a registered trademark of the National Committee for Quality Assurance.

^aEstimates of diabetes may not delineate between type 1 and type 2 diabetes. According to the American Diabetes Association, type 2 diabetes accounts for 90%-95% of all diabetes cases. Therefore, statistics that describe diabetes may be more characteristic of type 2 diabetes.⁶
